

Privacy as Code - A Buyer's Guide

Are you tired of playing catch-up with privacy policies and data regulations? Organizations today grapple with safeguarding vast amounts of personal data against cyber threats while complying with stringent regulations like GDPR and CCPA. The consequences of failing to protect this data are severe, ranging from financial penalties to loss of trust. As the digital landscape evolves, so does the need for robust privacy strategies.

The cost of privacy incidents continues to climb, with organizations spending more each year to mitigate risks and comply with an ever-expanding tapestry of regulations. This chart illustrates the escalating financial toll of privacy incidents over time.

Engineers and lawyers frequently find themselves at opposing extremes of the data protection spectrum. Engineers design and maintain systems, whereas lawyers have to deal with the complicated web of privacy rules and regulations. Relyance AI's Privacy as Code solution bridges this gap, offering a platform that easily integrates privacy into the core fabric of your organization's operations.

The Edelman Trust Barometer indicates that between 2012 and 2021, consumers' trust in technology dropped from 77% to 68%. Conversely, people's trust in business in general increased from 47% to 59% in the period.

Why Old-School Privacy Scanners Aren't Enough?

Old-school privacy scanners are insufficient because they're reactive, addressing issues only after they occur and failing to integrate with the SDLC. They focus on audit trails, policy checks, and anonymization post-development.

While the market offers various privacy solutions, many fall short in integrating privacy controls at the early stages of development and providing real-time tracking of sensitive data. Relyance AI addresses these gaps by embedding privacy into the development process.

What sets us apart?

To bridge the gap between these industry challenges and the ideal of seamless privacy integration, let's examine how Relyance AI stands apart in the following comparison:

Offerings	With Relyance AI	Without Relyance AI
Audit Trails & Consent	Code Level embedded	Post Development/ Partial automation
SDLC Integration	Comprehensive	Manual/limited integration
Automation	Fully automated	Manual/semi-automated
Anonymization	Semantic Analysis	Data anonymization/Classic Techniques/Report SDKs
Visibility to Data Flows	Compiler-like scan	Rule-based/limited visibility
Universal ROPA	One-click Compliance	Survey-based Method

At Relyance AI, we recognized these challenges and have implemented a **groundbreaking approach: Privacy by Design** using a shift-left methodology. By embedding privacy controls into every stage of the software development lifecycle (SDLC), we ensure privacy becomes a foundational element of software design.

We are the only player in the market currently offering this innovative solution. With our Continuous Compliance Monitoring and Management Platform, organizations can proactively manage privacy risks, enhance compliance, and build trust among customers and stakeholders.

Our Approach

We integrate privacy controls directly into the software development lifecycle with **Privacy By Design**, offering a proactive and automated approach to privacy compliance. This not only minimizes risks but also significantly reduces costs associated with late-stage privacy issue remediation as we see in the above illustration chart.

The Privacy by Design Imperative

At the heart of modern privacy compliance is the concept of Privacy by Design (PbD), which advocates for privacy to be embedded into the design of technology and business practices, guided by the seven fundamental principles by **Dr. Ann Cavoukian**. For us, this means integrating privacy controls directly into the code where data is processed and stored.

Our innovative privacy scanning relies on semantic analysis, a technique similar to how compilers carefully examine code. This enables thorough tracking of sensitive data in real-time, ensuring real-time compliance with privacy policies and regulations.

Semantic Analysis: A Game-Changer for Privacy Scanning

Semantic analysis is at the heart of Relyance AI's Continuous Compliance Monitoring and Management Platform. This method provides a holistic view of data operations, accommodating the diversity of modern codebases and the dynamic nature of data types.

Six Key Benefits of Automated Privacy Scanning with Relyance AI

1. **Enhanced Visibility:** Gain unparalleled insight into internal and external data processes, transcending the limitations of hard-coded rules and manual integrations.
2. **Universal ROPA Compliance:** Achieve comprehensive ROPA compliance with an up-to-date data map and inventory that adapts to the requirements of all regulators.
3. **Efficient Contract Monitoring and DSR Support:** Utilize NLP for continuous contract and policy analysis, ensuring operational reality aligns with privacy commitments.
4. **True Automation:** Relyance AI's semantic analysis automates privacy management, eliminating the need for manual labor and continuous rule creation by engineers.
5. **Integration:** Integrate privacy scanning into existing work processes, supporting a wide range of languages and development environments.
6. **Supporting Cross-Functional Collaboration:** Relyance AI's platform fosters collaboration between legal and engineering teams by embedding privacy scanning within the SDLC, which facilitates a unified view of data operations and enables proactive privacy management.

Our Solution: Pioneering Privacy Integration with Technical Precision

At Relyance AI, we've taken a deeply technical and unique approach to providing a continuous privacy data compliance solution, **grounded in the principles of Privacy by Design (PbD)**.

It offers real-time automated solutions that match the speed of privacy with business operations by integrating with the right technology stack.

Here's how Relyance AI tackles privacy concerns in a step-by-step process:

The Process:

1. **Gathering Evidence:** Collects data from 3rd party sources, data stores, code, and infrastructure.
2. **Deep Dive Analysis:** Uses semantic analysis to understand how data is handled and stored.
3. **Identifying Privacy Risks:** Pinpoints potential privacy risks within systems.
4. **Creating Actionable Insights:** Generates custom AI models for data classification and risk assessment.
5. **Continuous Vigilance:** Provides ongoing monitoring for proactive risk management.

Relyance AI is more than just a tool; it's a partner in your journey toward data privacy by design.

Your Go-To Checklist when choosing the best Privacy Solutions

- ✓ Real-time data tracking: Can you see exactly what's happening with your data at any given moment?
- ✓ Data Mapping: Do you have a complete picture of your data, regardless of where it resides?
- ✓ Proactive risk identification: Are you proactively identifying and mitigating potential privacy risks before they become problems?
- ✓ Compliance Automation: Can you streamline compliance efforts and stay up-to-date with evolving privacy regulations?
- ✓ Integration: Does the solution integrate seamlessly with your existing technology stack (source code, SaaS tools)?
- ✓ Does the solution work across different programming languages and environments?
